

WEBINAR

A cloud-native approach to accelerate BIAN implementation, in the open source way

October 13, 2020 | Q&A

Question
<p>The cloud has been widely adopted across various industries and has become a pillar of the IT systems of modern companies. Yet challenges remain for banks, mostly because of strict data regulations, doubts around data security, third-party risks and transformation challenges.</p> <p>How can BIAN / Red Hat/IBM address these issues?</p>
<p>Are you targeting any specific technology (e.g. Kubernetes)? It is possible to leverage this on both On prem / cloud environments?</p>
<p>Is there a link between this Mercury initiative at Redhat and the IBM Cloud for Financial Services initiative?</p>
<p>Which tool is supporting the choreography of the interactions between each component?</p>
<p>Where does BIAN stand in relation to groups such as FinOS? It seems like a perfect place to collaborate on this type of topic.</p>

All questions have been answered in the Q&A session at the end of the webinar – please view the recording!
